"Working with kids is the way to reach out to all of the farmers and talk to them about a different way-of doing things."— Lucia Gamez, La Olivilla

For Spain's 'La Olivilla,' Winning Top Award, Restoring Nature Go Hand in Hand

Just five years ago, a group of neighbouring farmers in Sierra de Cazorla, Spain decided to work together and produce high-quality olive oil with respect for the-environment. Last month, their Dehesa de la Sabina earned the industry's top award.

Five years ago, a group of neighbouring farmers in Sierra de Cazorla, Spain saw their 500-year old olive trees slowly dying. They took courses in-organic farming-and decided to work together to restore their groves, produce high-quality olive oil and establish a model of environmental-stewardship.

They learned that producing a world-class extra virgin olive oil in a sustainable way meant they needed to look beyond and below the trees, to all-of the members of the complex ecosystem and restore the harmony that seemed to be diminishing through the effects of conventional farming-techniques and climate change.

Since then, their-Dehesa de La Sabina-monovarietal Picual has garnered critical acclaim including a Best in ClassAward at the recent 2017 New-York International Olive Oil Competition.

The members — Sebastian Romero, Miguel Angel Romero, Enrique Gonzalez, Vicente Morillas, Damian Sanchez, Leon Bayona, Juan Ignacio-Valdes, Luciano Gamez — are showing their community a better way to farm that restores nature's delicate balance, setting an example for a new-generation.

It started when the neighbouring farmers were having some common problems with their land. "They were looking for solutions and they all went-toward trying organic farming. It was a big unknown, they didn't know what else to do," Lucia Gamez, the daughter of Luciano Gamez, told Olive-Oil Times publisher Curtis Cord during an interview on the-On Olive Oil-podcast.

"They invited technicians to their olive groves and tried everything they were advised. The one thing that had not tried yet was organic farming. To-do that they enrolled in some studies and so that's how they all met, during this course."

Soon it was revealed that the issues they were having stemmed from the declining biodiversity of the landscape. They discovered, for example, that-birds of prey were disappearing from the groves.

"When I was little, I grew up among the olive trees and we used to see owls in each olive tree. We even have Spanish sayings around that. Today if-you go to the groves, you see none. There are no birds of prey, no owls. They have slowly disappeared. There is essentially no life," Gamez said.

"When you drive around areas where there is a lot of olive farming, all you see is a lot of trees, which is beautiful, but if you pay attention, you-look closely into the ground, the earth, it's dead. It's dry, it's empty, there is no life in there. If there is no life, insects, birds, animals, cannot live in-there. So they all go. And that's what is happening today. As a result, the olive tree largely depends on a human intervention to actually survive. Because there is no life in the earth, there is no nutrient and there is no natural way of fighting pests."

The farmers contacted-BirdLife International, a wildlife conservation group that Gamez said, "views olive farming as a key to restoring the bird-population" and they learned how the two were quite codependent.

"The location where we are is suffering a desertification process sometimes," Gamez noted. "Because of the lack of water, it is extremely complex-to maintain the vegetation cover, so BirdLife International is helping us with additional practices in terms of recovering the ecosystem."

One of the first steps was to install accommodations to attract birds and the bugs they feed on. "We've partnered with schools to educate the kids-and they've constructed insect hotels, they've constructed bird houses to install in our
